## **Scorpion: Advanced Mobile Surveillance & Intelligence Platform**

**Scorpion** is a specialized surveillance and intelligence platform developed exclusively for authorized government agencies and law enforcement organizations. U.S. Government valued at **\$50 million**. **Scorpion** has been used by the U.S intelligences for over 15 years. Leveraging proprietary zero-day exploits and cutting-edge artificial intelligence, **Scorpion** enables operators to surveil and track any target cell phone in real time—delivering comprehensive visibility into device location, calls, texts, and other phone activity without requiring physical access or user interaction. Built for high-stakes operations, the system provides rapid, discreet intelligence gathering that supports investigations, threat assessment, and public safety missions while maintaining strict operational security.

At the core of **Scorpion** is its advanced fusion of zero-day exploitation techniques and self-learning AI models. These technologies allow the platform to penetrate modern smartphone defenses across all major manufacturers and operating systems. By analyzing live and historical device data, **Scorpion** transforms raw activity into actionable insights, revealing communication patterns, movement histories, and behavioral indicators that would otherwise remain hidden. The result is precise, reliable intelligence that enhances decision-making in dynamic law enforcement and intelligence environments.

**Scorpion** has an internal program called **Octopus**. **Octopus** has been in use since 2001. **Octopus** an AI program designed to monitor chatter worldwide and report when threat level of the chatter becomes consistent with a major terrorist event as it has done in the past: **September 11, 2001** New York World Trade Center bombing, **November 8, 2003** Riyadh compound bombing, **March 11, 2004** Madrid Spain subway bombing, **July 7, 2005** London Subway bombing, **March 11, 2020** Wuhan China Covid outbreak **Octopus** surveillance continues to operate worldwide.

**Morpheus** is a AI cyber program designed for conducting offensive cyber warfare. **Morpheus** is capable of fighting a cyber war across multiple countries from ground, air, sea, and satellites simultaneously. **Morpheus** technology tested and verified by independent 3<sup>rd</sup> party Department of War 2003-2013.

The secure web-based command center and dedicated mobile applications deliver intuitive dashboards directly to authorized users. Operators receive real-time visualizations, automated alerts for key events such as incoming or outgoing calls and messages, and customizable notifications tailored to specific mission parameters. Designed with agency workflows in mind, **Scorpion** includes comprehensive logging and compliance tools to support lawful surveillance requirements and evidentiary standards. What sets **Scorpion** apart is its continuously evolving architecture. The AI algorithms constantly monitor their own performance, adapt to new device security updates, and refine exploitation methods in real time. This self-improving capability ensures sustained effectiveness against evolving mobile technologies and encryption standards. **Scorpion** delivers the decisive technological advantage required for modern law enforcement and intelligence operations — providing authorized agencies with reliable, stealthy, and highly effective mobile surveillance capabilities in an increasingly connected world.
